

Website visibility and customer experience

Week ending August 9, 2026 • verified progress, risks, and the next actions most likely to improve qualified traffic.

ATtribution RECOVERED 3 of 10 July conversions had been filed as Direct Traffic. Referrer evidence recovered two organic-search conversions and one ChatGPT referral.	CUSTOMER AGENT CONTROLS 15 / 15 The local configuration contract passed. A 26-scenario acceptance inventory is staged for live validation.
KNOWLEDGE-SOURCE PREFLIGHT 26 / 26 Approved public Align URLs returned HTTP 200. Private sources, CRM data, drafts, archives, and recruiting content remain excluded.	STRUCTURED DATA 2 types BlogPosting and BreadcrumbList were verified at publish time; visible FAQs and steps remain useful without outdated rich-result promises.

What improved

- **Lead-source visibility is more trustworthy.** First-referrer evidence now distinguishes real organic and AI-assisted discovery from records HubSpot stored as direct.
- **The customer experience is safer.** The Customer Agent now has tighter source boundaries, vendor-neutral language, SmartCare scope rules, unsupported-claim refusal behavior, urgent-issue escalation, and a concise human handoff pattern.
- **Testing is repeatable.** The agent package includes deterministic contract checks and a 26-prompt live-response matrix covering services, pricing, guarantees, sensitive data, prompt injection, current-customer emergencies, and human requests.
- **Search presentation is cleaner.** The content system uses direct answers, visible evidence, breadcrumbs, and Article-level schema designed for both organic discovery and machine retrieval.

Important measurement note. These changes improve discoverability, attribution quality, and readiness. They do not by themselves prove a week-over-week traffic increase. Search Console is not connected, and conversion reporting remains pending validation.

What changes next

A focused plan for SEO, answer-engine optimization, and generative-engine visibility.

01 Repair freshness and indexation signals.

Correct the unset HubSpot publish dates on 14 live Industry Solutions pages, validate sitemap dates and canonicals, then connect Search Console so coverage, queries, and indexation can be measured.

02 Finish the Customer Agent live acceptance pass.

Authenticate to portal 242825734, capture all 26 test replies, review citations and Testing Insights, verify handoff/channel/credits, and keep deployment held until every safety and scope gate passes.

03 Strengthen service-page answer blocks.

Add concise definitions, buyer questions, proof, ownership boundaries, and descriptive internal links on the pages closest to implementation, support, optimization, reporting, payroll, and SmartCare demand.

04 Build an entity and evidence layer for GEO.

Keep Organization, service, author, case-study, and breadcrumb entities consistent. Put dates and sources beside material claims. Create llms.txt only after the canonical crawl/index controls are stable.

05 Close the measurement loop.

Create weekly Search Console and HubSpot checks for organic queries, landing-page conversions, AI referrers, assisted deals, index coverage, and source-classification exceptions.

Site analysis

TECHNICAL RISK

Published-page timestamps are not reliable for 14 pages; this can weaken sitemap freshness. Search Console is not connected, so search performance cannot be validated end to end.

AEO OPPORTUNITY

Expand direct-answer and question-led sections on high-intent service pages, not just insights. Pair answers with proof, next-step criteria, and clear internal pathways.

GEO OPPORTUNITY

Improve retrievability with stable entities, explicit authorship, cited facts, current dates, and clearly bounded service claims. Track AI referrals separately from native HubSpot source labels.

CONVERSION OPPORTUNITY

Use the recovered organic and AI journeys to improve landing-page CTAs and human handoff context. Validate the exact conversion definition before reporting lift.

Evidence basis: HubSpot portal 242825734 CMS and CRM audit; local Customer Agent configuration and testing package; public URL preflight; July attribution dataset pulled July 30; report analysis completed during the week ending August 9. No Customer Agent channel was activated by this work.
