

Weekly Website Report

Week of **July 6–10, 2026** · Prepared for Dillon Mohr

Most of this week's work happened behind the scenes. These were backend and metadata improvements that help search engines and AI assistants read the site's existing content more clearly. Nothing changed in how the site looks or reads for visitors.

01 Blog content review

- ◆ Reviewed all 63 published posts and scored each for search and AI-answer readiness.
- ◆ Selected the highest-value posts that were missing supporting structure.
- ◆ No existing copy was rewritten; the visible articles read the same.

02 Backend improvements to 9 posts

- ◆ Added a short quick-answer summary and a small FAQ section to each of 9 posts.
- ◆ Added a light set of internal links and a contact prompt so readers can reach the team.
- ◆ Added two reputable third-party citations per post (SHRM, Bureau of Labor Statistics, Dept. of Labor, Gartner, Gallup) and removed non-credible vendor links.

03 Structured data (behind the scenes)

- ◆ Added hidden structured data to those 9 posts so Google and AI tools can identify the questions each page answers.
- ◆ This is formatting and metadata only, not visible on the page.

04 Measurement and automation

- ◆ Set up an automated daily site check (10 AM) covering new leads, traffic, and search / AI visibility.
- ◆ Set up this weekly website report so you get a recap every week.

05 Planning and next steps

- ◆ Prepared internal reference docs: a search / AI-visibility audit and a ranking roadmap (planning only, nothing published).
- ◆ Next week: extend the same backend improvements to more existing posts and begin buyer's guide content.

In plain terms: This was groundwork, not a redesign. The goal is to make the content you already have easier for search engines and AI assistants to find, understand, and cite. Results build gradually over the coming weeks.
